DÉTAILS DU PRODUIT

OZMO ROLLER 2.0 with Instant Self-Cleaning

Thanks to a pressure intensity of 3,800 Pa – equivalent to 16 times the power of two conventional disc mops – the DEEBOT with OZMO ROLLER 2.0 effortlessly removes even the toughest stains with unmatched cleaning power. The mop scrubs the floor at 220 rpm, delivering a streak-free shine without dirty-water residue – for a thorough clean. In addition, the redesigned, high-density nylon mop roller removes stains deep down while protecting the floor at the same time.

TruEdge 3.0 Extreme Technology for Edge Cleaning

The improved TruEdge 3.0 Extreme Technology for edge cleaning uses an air-cushioned mop with an extended reach of 1.5 cm. The variable shock-absorber system adjusts in real time, while the mop glides seamlessly along edges thanks to two new, soft rubber wheels – for thorough, gapless cleaning. The rigid side brush picks up debris along the edges, ensuring maximum cleaning coverage without manual effort.

AI Stain Detection 2.0

During cleaning, AI Stain Detection 2.0 automatically detects stains and applies the appropriate cleaning strategy depending on severity. For stubborn stains, a multi-stage cleaning process is used in a grid pattern with mop cleaning, plus a second pass. Light soiling is removed with a single-stage grid pattern within the identified area. This optimised intelligence ensures precise, adaptive cleaning to remove residue while protecting the floor.

Triple Lift Function for Brushes and Mops

The Triple Lift function for brushes and mops intelligently adapts to different cleaning scenarios, ensuring precise separation of dry and wet cleaning. On carpets, the mop is lifted to prevent moisture damage and keep the carpet dry. When liquids are spilled, both brushes are lifted to protect against contamination. Cleaning is carried out in a grid pattern with the mop, so that even stubborn stains are effectively removed. For large particles, the side brush is lifted to prevent dirt from spreading. The main brush provides strong suction power. The system enables effective separation of dry and wet cleaning with precise results, as well as optimal floor protection in every scenario.

ZeroTangle 3.0 Technology with Powerful Suction

Thanks to higher suction power and ZeroTangle 3.0 Technology against hair tangling, the DEEBOT T80S OMNI delivers powerful, low-maintenance deep cleaning. With suction power of up to 24,800 Pa, it effortlessly removes dust, particles and deep-seated dirt – even from carpets. The spiral anti-tangle side brush and the cyclone main brush efficiently guide hair into the suction stream, preventing hair tangling and reducing knots to almost 0% – for truly worry-free cleaning.

AIVI 3D 3.0 Omni-Approach Technology

Using a vision-language model, AIVI 3D 3.0 Omni-Approach Technology precisely captures the contours of all obstacles and navigates in real time along detected objects – for comprehensive cleaning of every area.

98 mm Low-Profile Robot

By introducing an integrated radar and comprehensive structural optimisation, the DEEBOT T80S OMNI features an ultra-slim housing just 98 mm high, equipped with a water-renewal system and an extendable arm.

Handles Obstacles Up to 20 mm High

With its grippy drive wheels and a special obstacle-crossing strategy, the DEEBOT handles obstacles up to 20 mm high with ease in both dry and wet environments.

Hot Water Wash with Soaking Function

In the cleaning tray, the mop is dipped in water of up to 75°C and wrung out, loosening stubborn dirt. The mop is then lifted to drain dirty water – for residue-free cleanliness.

Hot Air Roller Drying at 63°C

Thanks to the direct, 63°C hot airflow from a short distance and the rotating roller that removes dirt during drying, the mop is thoroughly cleaned all around and is completely dry in just two hours.

Automatic Dust Emptying and 150-Day Maintenance-Free Mop Cleaning Tray

The dust bin empties automatically, keeping your hands free from contact with dirt. Thanks to the mop cleaning tray, which allows up to 150 days of maintenance-free operation and only needs to be removed once or twice a year, you never have to do it yourself.
